

## ABSTRACT OF THE DISCLOSURE

A vacuum cleaner having a suction brush movably disposed at a lower portion of a cleaner body, a by-pass motor disposed in the cleaner body and generating a suction force at the suction brush. A cyclone dust-collecting apparatus disposed in the cleaner body has  
5 an inflow passage, into which air passing by the by-pass motor flows, and an outflow passage through which the air, cleaned by the separation effect of the centrifugal force created within the dust-collecting apparatus is discharged. A dust bag is disposed in the cleaner body and connects to the outflow passage for filtering minute dust entrained in the once cleaned air which is discharged from the cyclone dust-collecting apparatus.
